New isolated human sodium-dependent phosphate to develop products for treating e.g. cancers, Alzheimer's disease, diabetes, encephalopathy, hypocalciuria or hypoglycaemia. Claim 1; Fig 1; 66pp; English. This sequence is the human sodium-dependent ph (NAPTR) of the invention. NAPTR and agonists of prevent disorders associated with decreased e.g. cancers of the kidney, disorders of decre including tumoural calcinosis, osteomalacia, o hypophosphatemia, rickets, cysteneuria, nephroposphatemia, rackets, cysteneuria, nephroposphatemia, rickets, cysteneuria, nephroposphatemia, rickets, cysteneuria, nephroposphate, racidomyopathy, mypokalaemia, external ophthalmoplegia, Kearns-Sayre syndrom encephalopathy, cardiomyopathy, hypokalaemia, disorders of cell signalling through cAMP, ATP glucose-6 phosphate levels, e.g. hypocalciuria abnormal phosphate regulation in neurons, gast liver. The products can also be used for detec screening.                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes hereditary haemochromatosis gene products from the human haemochromatosis gene. Also described is a method to determine the presence or absence of the common hereditary haemochromatosis (HFE) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence of a haplotype or genotype where the presence or absence of the haplotype genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BTF genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists and antagonists of BT function. Also described are: (1) a RoRet gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type 1 sodium transport gene, and can similarly be used for hypophosphatemia. The present sequence represents
                                                                                                                                                                                                                    Query Match

                  DNA or RNA for the presence or absence of a haplotype or genotype where the presence or absence of the haplotype genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BTF genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists and antagonists of BT function. Also described are: (1) a RORet gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type 1 sodium transport gene, and can similarly be used for hypophosphatemia. The present sequence represents
                 NTP3.
                                                                                                                                                                                                                                                       products from the human haemochromatosis gene. Also described is a method to determine the presence or absence of the common hereditary
                                                                                                                                                                                                                                                                                         Claim 54; Fig 5B; 209pp; English.
The present invention describes hereditary haemochromatosis

                                                                                                                                                                                                         countertransporter (ISCT) BNPI. A DNA sequence for human BNPI is provided (see V33503). LSCTs such as BNPI provide the physiological mechanism for the extrusion of lithium from cells, i.e. it regulates the cell concentration of lithium. Its activity determines the therapeutic effect of lithium. The invention provides a simple molecular biological test for the ability of cells to extrude lithium. The LSCTs have significance for cells to extrude lithium. The LSCTs have significance for determining the responsiveness of humans with mental disorders, including manic depressives, to treatment with lithium salts. Probes and primers for BNPI, PIT-1 (see W70499) can be used in diagnostic tests useful for genetic screenings to predict whether a patient will respond to lithium calls that the test is also a screen for susceptibility to, and extent of, manic depressive illness, and is suitable for screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated lithium-sodium counter-transporter DNA - used to develop products for evaluating lithium-sodium transport in erythrocytes, particularly for lithium therapy in manic depression claim 8; Page 45-47; 64pp; English.

This polypeptide comprises the brain-specific human lithium-sodium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gunn RB, Timmer RT WPI; 98-520759/44. CC elegans: The eat-4 gene is a cAMP regulatory gene. The specification CC describes the identification of compounds for treating (or preventing CC areporter gene linked to a cAMP (cyclic adenosine monophosphate) CC are gulatory gene or promoter, with a test compound and measuring CC expression of the reporter gene. Such compounds are potentially useful for treating and preventing Alzheimer's, Parkinson's and Huntington's CC diseases, amyotrophic lateral sclerosis, multiple sclerosis, stroke or CC diseases, amyotrophic lateral sclerosis, multiple sclerosis, stroke or CC canoriabditis elegans, constitutive activation of the GTP-binding CC some genes, including adenylyl cyclase-type genes, block Gas-induced cell death, suggesting that the effect of Gas is associated with changes in

Eat-4 protein amino acid sequence.
Eat-4 protein; cAMP regulatory gene; neurodegeneration; cAMP;
Cyclic adenosine monophosphate; reporter gene; Alzheimer's; Parkinson's;
Huntington's disease; amyotrophic lateral sclerosis; multiple sclerosis;
stroke; epilepsy; GTP-binding protein G alpha s; Gas;
adenylyl cyclase gene; Gas-induced cell death; cAMP level.

This protein, encoded by DNA derived from Acremonium chrysogenum, involved in biosynthesis of cephalosporin C. The gene involved in biosynthesis of cephalosporin C or its cDNA can be used to improve fermentation ability of Acremonium chrysogenum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chrysogenum

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cells and a process for producing the TR protein are claimed. TR polypeptides and polynucleotides are useful for diagnosing diseases related to over or under expression of TR protein by identifying mutations in the TR gene, or determining TR polypeptide or mRNA expression levels due to an infection of an organism with the TR gene (claimed). They can diagnose the stage and type of infection TR is also useful for screening for compounds which affect the TR activity. These can be used in treatment to inhibit (antagonist i.e. antibacterial drugs) or enhance (agonist) TR activity. Direct administration of TR polypeptides can be used to treat conditions associated with a lack of TR (claimed). Direct administration of
                                                                                                                                                                                                                                                                            respiratory tract (e.g. otitis media), cardiac (e.g. infective endocarditis), gastrointestine (e.g. splenic abscess), CNS (e.g. cerebral abscess), eye (e.g. conjunctivitis), kidney and urinary tract (e.g. epididymitis and toxic shock syndrome), skin (e.g. wound infection), and bone and joint (e.g. septic arthritis). TR polypeptides, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial infection. TR is
                                                                                                                                                                                                                                                                                                                                                                                                                                                           antisense oligonucleotides prevents expression. TR polypeptides (administered directly, in a vector (gene therapy) and as a vaccine) and antibodies induce an immune response to immunise and prevent disease (claimed). Diseases diagnosed, prevented or treated include: bacterial, especially S. aureus, infections of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid of a novel tetracycline resistance protein (TR) of Staphylococcus aureus WCUH29 (NCIMB 40771) thta is involve in sugar or drug transport across bacterial cytoplasmic membranes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Staphylococcus aureus tetracycline resistant protein and gene useful as diagnostic reagents and for prevention and treatment of staphylococcal infections, including toxic shock syndrome and otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TR polynucleotide (see X07357) has been isolated from an S. aureus DNA library.                         diseases caused by virus claim 1; Pages 108-112; 128pp; Japanese.

The present sequence represents a fragment of a new Hepatitis g virus protein (see also W56441-50 for other fragments). RNA was synthesised from the serum of nine patients judged positive for Hepatitis g virus and cDNA synthesised from this RNA. The cDNA was used as a template in several PCR reactions to isolate fragments of the new gene. The gene may be useful for diagnosing and developing treatments for Hepatitis g
                                                                                                                                                                                                                                                                                                                                                                                                 31-JUL-1998 (first entry) Fragment HGJ2141 of a new Hepatitis virus g

The present sequence represents a fragment of a new Hepatitis g virus protein (see also W56441-50 for other fragments). RNA was synthesised from the serum of nine patients judged positive for Hepatitis g virus and cDNA synthesised from this RNA. The cDNA was used as a template in several PCR reactions to isolate fragments of the new gene. The gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              reayment F1029 of a new Hepatitis virus g protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hepatitis G virus gene - useful for diagnosing and treating diseases caused by virus (laim 1, Pages 104-108; 128pp; Japanese. Claim 1, Pages 104-108; 128pp; Japanese. The present sequence represents a fragment of a new Hepatitis g virus protein (see also W56441-50 for other fragments). RNA was synthesised from the serum of nine patients judged positive for Hepatitis g virus and cDNA synthesised from this RNA. The cDNA was used as a template in several PCR reactions to isolate fragments of the new gene. The gene may be useful for diagnosing and developing treatments for Hepatitis g virus diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           s1-JUL-1998 (first entry)

The present sequence represents a fragment of a new Hepatitis g virus protein (see also W56441-50 for other fragments). RNA was synthesised from the serum of nine patients judged positive for Hepatitis g virus and cDNA synthesised from this RNA. The cDNA was used as a template in several PCR reactions to isolate fragments of the new gene. The gene may be useful for diagnosing and developing treatments for Hepatitis control of the server of the new gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              virus diseases.
